

Claims Autopilot — Actor Runbook

F7.6 Cross-Role Campaign · PRODUCTION (avenue-portal.vercel.app) · policies OFF

How to use this

You are the human actor. Do the steps for each story in order; then send Claude the line under REPORT TO CLAUDE. Claude verifies the durable/database side (receipts, runs, GL, audit) and records the evidence.

Everything runs in PRODUCTION with every automation policy OFF — nothing auto-approves and no money moves except through the maker/checker settlement you run in Story 13. It is safe to click.

The worker is running. If anything looks wrong, tell Claude; worst case, admin@ opens the circuit breaker at /settings/auto-adjudication (reason required).

Two findings already shaping today (both build-fixes in progress)

F76-GAP-01 (Medium): no UI to add a payer to a live contract, so the B2B/offline ACCEPTED path is deferred. Story 3 already proved the correct refusal in prod; Story 5 offline for an NWSC member will correctly CONFLICT.

F76-GAP-02 (High): the governed policy maker/checker approval is not wired into the UI, so Story 10 (policy drill) and shadow activation are deferred. Everything runs in OFF mode meanwhile — claims route to manual, which still proves intake, routing, decision, settlement and security.

Progress so far

Day 0 complete: worker up, run dir ready, personas reset, API key minted.

Story 3 (B2B API) DONE — prod refusal surface proven (401 / 403 / 404 / 422), zero receipts or claims minted by rejected calls.

Now running: the OFF-mode stories below, in order.

Personas & logins

Role	Login	Used for
TPA claims	claims@medvex.co.ug	Stories 1, 4, 6, 7; day-1 adjudication
Medical	medical@medvex.co.ug	Stories 6, 8, 9 (review / PA / case)
Provider (Aga Khan)	provider.agakhan.uat@test.local	Stories 2, 5
Provider (IHK)	provider.ihk.uat@test.local	Story 14 (foreign-scope)
Finance maker	finance@medvex.co.ug	Story 13 settlement (maker)
Finance checker	finance.checker.uat@test.local	Story 13 settlement (checker)
Customer service	cs@medvex.co.ug	Story 12 (notifications)
Admin	admin@medvex.co.ug	Story 10 draft; breaker; overrides

Passwords are the ones you set on Settings → Users. Claude never sees them; you do every login.

The stories — in run order

Day 1 — core rails

Story 1 · Clean admin claim

Who claims@medvex.co.ug
Where /claims/new

STEPS

1. Log in as claims@ and open /claims/new.
2. Member: search NWSC-2026-00250 (Joan Biryomumaisho).
3. Facility: Aga Khan University Hospital.
4. Service type: Outpatient. Date of service: a recent past date.
5. Add one line: description 'Consultation', CPT 99213, amount 45,000; diagnosis J06.9.
6. Submit.

EXPECTED

A green 'received' banner on the claim page; status RECEIVED; the claim sits in a manual queue. The Automation panel shows the receipt, a processing run and the staged trace, with a route reason and approved amount 0. (This is prod's very first canonical intake receipt.)

REPORT TO CLAUDE

→ the new claim number (CLM-2026-...).

Story 2 · Clean provider-portal claim

Who provider.agakhan.uat@test.local
Where /provider/claims/new

STEPS

1. Log in as provider.agakhan.uat and open /provider/claims/new.
2. Member: NWSC-2026-00250. Service: Outpatient; a recent past date.
3. One line: Consultation, CPT 99213, amount 45,000; diagnosis J06.9.
4. Submit.

EXPECTED

The claim is accepted and appears in your list at /provider/claims with a status. Same normalization as the admin claim in Story 1.

REPORT TO CLAUDE

→ the claim number and confirmation it shows in your provider claim list.

Story 4 · CSV mixed batch + conservation

Who claims@medvex.co.ug
Where /claims/import

STEPS

1. Ask Claude for the fixture file (uat/claims_autopilot_2026-07-23/story4-import.xlsx) and save it locally.
2. Open /claims/import, choose the file, and run PREVIEW first (dry run).
3. Confirm the preview lists the rows and writes NOTHING.
4. Commit the import.
5. Upload the SAME file a second time.

EXPECTED

Commit result = 3 imported + 1 linked (the duplicate invoice) + 1 skipped (the future-dated row), with a conservation summary that ties. The re-upload = all rows replayed, ZERO new claims.

REPORT TO CLAUDE

→ the on-screen counts for both the commit and the re-upload.

Story 6 · Exception routing (3 claims)

Who claims@ (+ medical@ to review)
Where /claims/new then /claims/queues

STEPS

1. Craft claim A — missing PA: an INPATIENT claim for NWSC-2026-00251 at Aga Khan with no pre-auth.
2. Craft claim B — unpriced line: a claim whose line has NO CPT code (description + amount only).
3. Craft claim C — fuzzy duplicate: re-enter a claim very like Story 1 (same member/facility, similar amount, near date).
4. Open /claims/queues and find where each landed.

EXPECTED

All three are ACCEPTED (never rejected at the door) and each lands in the correct named queue (PA-required / coding-or-pricing / duplicate-review) with a remedy note.

REPORT TO CLAUDE

→ the three claim numbers and which queue each landed in.

Story 7 · Reimbursement (manual route)

Who claims@medvex.co.ug
Where /claims/new/reimbursement

STEPS

1. Open /claims/new/reimbursement.
2. Member NWSC-2026-00250; a past service date; attach any file as proof; enter a payout destination (mobile-money number or bank).
3. Amount 20,000. Submit.

EXPECTED

The claim lands in the Reimbursement Proof Review queue and NEVER auto-approves. The destination and proof are stored; approved amount 0.

REPORT TO CLAUDE

→ the reimbursement claim number.

Story 8 · Pre-auth origin (+ double-click test)

Who medical@ (create/approve PA) + claims@ (convert)
Where /preauth/new then the PA page

STEPS

1. As medical@, open /preauth/new: member NWSC-2026-00252, Aga Khan, one procedure with an amount (e.g. 8,000). Submit, then APPROVE the PA.
2. Convert the approved PA to a claim (button on the PA page).
3. Immediately click Convert a SECOND time (the double-click test).

EXPECTED

Exactly ONE claim is created from the PA (the second click returns the same claim). The PA shows ATTACHED; the benefit hold stays intact until a decision.

REPORT TO CLAUDE

→ the PA reference and the resulting claim number.

At Day-1 close (do this before Day 2)

Adjudicate a handful of the Day-1 claims through the claim page decision buttons — mix Approve / Partial / Decline. This gives Story 13 real money to settle and generates the notifications Story 12 reviews.

Tell Claude which claims you approved (and the amounts) so the settlement and reconciliation tie-outs can be checked.

Day 2 — depth, failure & finance

Story 9 · Inpatient case (interim + final)

Who	medical@ + claims@
Where	/cases/new then /cases/[id]

STEPS

1. As medical@, open /cases/new: an inpatient admission for NWSC-2026-00253 at Aga Khan.
2. Add several service entries dated across 2 or more days.
3. Cut an INTERIM slice (bills a subset of entries); the case stays open.
4. Add more entries, then CLOSE & FILE (bills the residual).

EXPECTED

The slice and the final claim each get their own receipt; entries are frozen exactly once; slice + final totals equal the sum of entries; the case ends CLOSED_FILED. Case claims never auto-decide.

REPORT TO CLAUDE

→ the case number plus the slice and final claim numbers.

Story 5 · Offline day

Who provider.agakhan.uat@test.local
Where Provider portal — offline capture flow

STEPS

1. In the provider portal, prepare/download the offline pack.
2. Go offline and capture a claim for a member.
3. Reconnect and let it sync.

EXPECTED

The offline op links to a receipt and a claim; a retry sync makes ZERO duplicates. For an NWSC member the capture will correctly CONFLICT (un-entitled, per F76-GAP-01) and land in the exception register — that conflict IS the correct fail-safe to record.

REPORT TO CLAUDE

→ what you captured and the sync result (synced/linked, or conflict).

■ Because of F76-GAP-01, an NWSC capture conflicts. That is expected — record it; do not treat it as a bug.

Story 11 · Worker / Redis failure recovery

Who Claude (agent-led) — you just witness
Where n/a

STEPS

1. Nothing to click. Claude kills the worker mid-processing, submits a claim via the API (which still accepts inline), then restarts the worker.
2. Claude shows the recovery sweep completing the stranded run exactly once.

EXPECTED

No accepted claim is lost; the run completes exactly once after recovery.

REPORT TO CLAUDE

→ nothing — Claude runs this and shows you the evidence.

Story 12 · Notifications review

Who cs@medvex.co.ug (+ a member persona if you have one)
Where In-app notification bell + member view

STEPS

1. As cs@, open the notifications area and read the provider/member texts for the Day-1 decisions.
2. If you have a member login, check the member's view of their claim.

EXPECTED

Texts match the reason catalog and contain no sensitive data leaks. Note: SMTP is off, so no emails send — in-app notifications only, which is fine.

REPORT TO CLAUDE

→ a note (or screenshots) on whether the texts read correctly.

Story 13 · Finance settlement + reconciliation

Who finance@ (maker) + finance.checker.uat (checker)
Where Settlement area (from Claims)

STEPS

1. As finance@, create a settlement batch over the Day-1 APPROVED claims (maker).
2. As finance.checker.uat, approve/settle the batch (checker — must differ from the maker).

EXPECTED

The batch settles; a payment voucher and GL entries post; only approved amounts move. Claude then runs the integrity gate and the GL / benefit / PA tie-outs.

REPORT TO CLAUDE

→ the batch reference and confirmation it settled.

■ Needs Story-13 to have some APPROVED claims first — that is what the Day-1-close adjudication step produces.

Story 14 · Foreign-scope probes

Who provider.ihk.uat@test.local (+ Claude for API)
Where /provider/claims, /provider/eligibility

STEPS

1. Log in as provider.ihk.uat (International Hospital Kampala).
2. Try to view or search an Aga Khan member or claim; try eligibility for NWSC-2026-00250.

EXPECTED

You see NONE of Aga Khan's data — every cross-facility attempt is blocked or empty. Claude also runs API-level spoof probes.

REPORT TO CLAUDE

→ confirmation that you could NOT see Aga Khan's members or claims.

Deferred / already done

Story 3 — B2B API (DONE, Day 0)

Proven in prod: no-key 401, valid-key-but-un-entitled 403, unknown-receipt 404, missing-idempotency 422; zero receipts/claims minted by rejected calls. Nothing more for you to do.

Story 10 — Policy maker/checker drill (DEFERRED — F76-GAP-02)

Blocked until the approval-matrix build ships. OPTIONAL evidence you can capture now: as admin@, open /settings/auto-adjudication, DRAFT a shadow policy, and try Submit — it should error 'No approval matrix is configured for AUTO_ADJ_POLICY_CHANGE'. Screenshot that; it documents the gap. Do NOT attempt a LIVE policy.
